Thank you...

...for choosing Gin Gliders. We are confident you'll enjoy many rewarding experiences in the air with your GIN harness.

This manual contains important safety, performance and maintenance information. Read it before your first flight, keep it for reference, and please pass it on to the new owner if you ever re-sell your rescue.

Any updates to this manual, or relevant safety information, will be published on our website: www.gingliders.com. you can also register for e-mail updates via our website.

Happy flying and safe landings,
GIN team

Warning

Like any extreme sport, paragliding involves unpredictable risks which may lead to injury or death. By choosing to fly, you assume the sole responsibility for those risks. You can minimize the risks by having the appropriate attitude, training and experience and by properly understanding, using and maintaining your equipment. Always seek to expand your knowledge and to develop self-reliance. If there is anything you do not understand, consult with your local dealer as a first point of contact, with the GIN importer in your country or with Gin Gliders directly.

Because it is impossible to anticipate every situation or condition that can occur while paragliding, this manual makes no representation about the safe use of the paragliding equipment under all conditions. Neither Gin Gliders nor the seller of GIN equipment can guarantee, or be held responsible for, the safety of yourself or anyone else.

Many countries have specific regulations or laws regarding paragliding activity. It's your responsibility to know and observe the regulations of the region where you fly.

About Gin Gliders

Dream

In forming Gin Gliders, designer and competition pilot Gin Seok Song had one simple dream: to make the best possible paragliding equipment that pilots all over the world would love to fly—whatever their ambitions.

At Gin Gliders, we bring together consultant aerodynamists, world cup pilots, engineers and paragliding school instructors, all dedicated to fulfilling this dream.

Touch

We're a "hands-on" company that puts continuous innovation and development at the center of everything we do.

At our purpose-built R&D workshop at head office in Korea, we are able to design, manufacture, test-fly and modify prototypes all in a matter of hours. Our international R&D team is on hand both in Korea and at locations worldwide. This guarantees that your equipment has been thoroughly tested to cope with the toughest flying conditions.

Our own production facilities in East Asia ensure the quality of the finished product and also the well-being of our production staff.

Believe

We believe that the product should speak for itself. Only by flying can the pilots understand their equipment and develop trust and confidence in it. From this feeling comes safety, comfort, performance and fun. The grin when you land should say it all!

Introducing the Genie Lite 2

The Genie Lite 2 is for sport and XC pilots who want a light cocoon harness with all the essential features and no compromises in comfort.

Comfortable and aerodynamic

Drawing on our technology from the Genie Race 3, the Genie Lite 2 has been designed for maximum XC comfort. The back of the harness is robust, with support that contours to the back in all the right places thanks to the 3D shaping. A removable lumbar support can be adjusted to give the perfect fit. Much time was spent in development to make the profile as clean and wrinkle-free as possible.

Stable geometry

The Genie Lite 2 is reassuring in turbulence as a result of careful optimization of the height of the carabiner attachment points and the overall harness geometry. Piloting and feedback is precise and informative, thanks to the carbon fiber seat board.

Convenience and versatility

The cocoon is easily detachable for additional weight savings and optional cocoon sizes for customization.

Specifications

The Genie Lite is EN and LTF certified.

Certification number: EAPR-GZ-0443/15

| Size | XS | S | M | L |
|-------------------|------|---------|---------|------|
| Weight (kg) | 3.9 | 4.1 | 4.4 | 4.6 |
| Pilot height (cm) | <165 | 160-175 | 170-185 | >180 |

Delivery package

- 1 Harness
- 1 Carbon seat plate and foot plate
- 1 Cocoon
- 1 Flight deck (integrated into cocoon)
- 1 Rescue deployment handle
- 1 Rescue bridle
- 2 GIN 30mm carabiners

Components of the Genie Lite 2

Back Protection

The Genie Lite comes with the Ginsoft Lite 2 14cm mousse bag foam back protector. The back protector is divided into separate compartments to help dissipate air evenly in the event of a hard impact. This protects the pilot as much as possible in the event of an incident, but it cannot completely eliminate the risk of injury. The Genie Lite 2 back protection is EN certified.

Flight Deck

Included with the Genie Lite 2 harness is a custom designed flight deck. The flight deck is designed to seamlessly connect with the cocoon, providing you with room for a GPS and vario or other flying instruments. The flight deck also has a 5L pocket to be used for storing easy access items in flight or as a ballast.

Hook knife

Connected to the removable instrument panel is a hook knife. This can be used in an emergency to cut away lines or webbing. It is conveniently located in direct sight of the pilot and easy to reach for rapid extraction.

GIN carabiners

Included with your harness is a pair of GIN 30mm green carabiners. The Genie Lite 2 is also compatible with quick release carabiners, it is up to the pilot to ensure they are compatible and installed correctly.

3D back support

Introducing the first ever adjustable lumbar back support. 3D cutting of the materials give the optimum shape to the seat, allowing it to perfectly conform to the pilot's back. 3D back support can be removed to maximize weight efficiency.

Carbon seat and foot plate

Included with your harness is a carbon seat plate and a carbon foot plate. This material is exceptionally strong while providing you with an incredibly light weight and durable product.

Before you fly

Make sure your dealer has checked the harness for completeness and basic settings. Your harness must be assembled by a suitably qualified paragliding professional, for example, your instructor.

GIN Gliders recommends that assembly be carried out in the following order. If you are in any doubt whatsoever about this procedure, please seek professional advice from your instructor, GIN dealer or importer.

Installing the speed system

Assemble the speed system from top to bottom. Pass the cord along the inside of the harness and route it through both pulleys (1). From the second pulley, route the cord through the metal ring at the bottom edge of the seat (2). Connect the cord to the speedbar using a secure knot (3). Finish by attaching the speedbars elastic cord to the foot plate of the cocoon. If flying without cocoon' remove elastic cord from the speedbar.

CAUTION: Make sure that the speed system is not too short. The front risers of your paraglider must not be pulled down in normal (unaccelerated) flight.

*See page 22 for speed system adjustment

Installing the seat plate

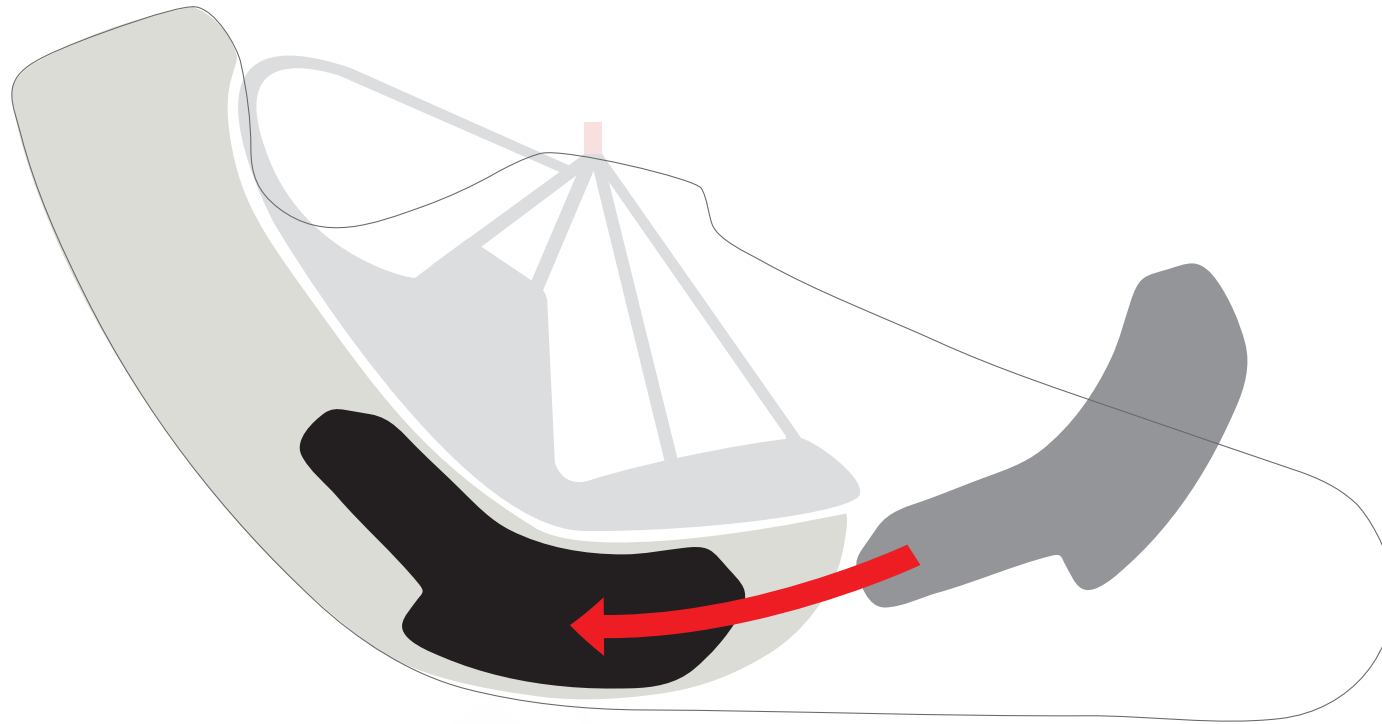

The seat plate is removable and can be accessed by a panel at the rear of the seat. Simply remove by separating the leg straps and pulling it out the back. When installing the seat plate be sure to loop the leg straps over the back edge of the seat (covered in Velcro). The seat plate should be installed with the Velcro edge to the back and the front curve facing down. When installing check that the leg straps are positioned at the back center of the seat plate pocket.

WARNING: Forgetting to loop the leg straps behind the seat plate will place the pilot in great risk of falling out of the harness.

Installing the back protector

To install the back protector in the Genie Lite harness, first open the under seat pocket. Inside is a zippered compartment to hold the back protector in the optimum position. Open the zipper and insert the back protector with the narrow end first. Help guide the back protector into the proper position making sure that the narrow top piece properly sits between the back support and the rescue container. The back protector should fit snugly into the container. Once you are sure the protector is installed correctly, close the protector compartment, followed by the under seat pocket.

Cocoon Connection

The Genie Lite 2 comes with an adjustable, lightweight cocoon. The cocoon helps to improve the aerodynamics of the harness to maximize your flying performance.

Connection

1. Attach the velcro of the cocoon to the bottom of the harness
2. Connect the zipper on the LEFT and RIGHT side of the harness
3. Attach the BLUE adjustment lines to the seat of the harness

Rescue Installation and compatibility check

Gin Gliders recommend that rescue installation is performed properly by a competent person. The rescue parachute is a pilot's last resort and failure to pack or connect the reserve parachute in the correct way may cause death or severe injury. The pilot is responsible for ensuring proper installation.

This harness is compatible with the One G, Yeti and Yeti Cross rescue parachutes. Other manufacturers' rescues may also be used but we cannot guarantee their function. The pilot is responsible for checking compatibility.

Every first installation of a rescue system into the harness (that means every new combination of harness and rescue system) must be checked by a qualified paragliding professional for compatibility. To verify the installation, you must perform a test deployment by sitting in a simulator.

Rescue parachutes should be repacked at least every 150 days; so installing your rescue in a new harness may also provide a good opportunity for a repack. After every repack of the rescue parachute you should also do a compatibility check.

Rescue compatibility

MAKE SURE THAT THE RESCUE PARACHUTE CAN BE RELEASED FROM THE RESCUE CONTAINER—it must be done by you, the pilot, sitting in the harness hanging from a simulator.

WARNING: If you are in any doubt about any aspect of rescue installation, seek professional advice!

IMPORTANT: You must perform a test deployment from a simulator to verify the installation.

Attaching the rescue deployment bag to the harness deployment handle

The rescue container for this harness comes with its own deployment handle. This handle and its strap must be connected to the deployment bag of the parachute. In particular, check the length of the strap connecting the rescue deployment handle to the rescue inner container. It should be long enough that the reserve can be extracted without the danger of the pins not being pulled before the strap tightens on the reserve, but not so long that there is excessive slack that extends the movement required for deployment.

The deployment bag of other manufacturers' rescue systems (i.e. non-GIN rescue systems) may have different loop positions which may cause a deployment failure. Be sure to contact your parachute dealer or a qualified professional to check the connection, position and secure deployment, and refer to the rescue manual for details.

IMPORTANT: The deployment bag of other manufacturers' rescue systems may have different loop positions which may cause a deployment failure.

Yeti Cross Inner bag

Handle attachment

Pass the handle through the center loop

Pass the handle through itself

Pull to make a clean, tight knot

GIN Square Type Inner Bag

For use with square type rescue containers (Yeti, One G) it may be necessary to use the rescue handle loop extender. For proper deployment the rescue handle should be connected to the center loop of the rescue inner bag. To connect to the center loop with square type rescues, first connect the loop extender (contact your dealer) using a figure-8 knot. Then pass the rescue handle through the center loop as shown.

IMPORTANT: Without the loop extender the rescue loop may pull tight on the rescue before the pins are released, this will cause the rescue container to fail.

7

8

Connecting the rescue bridle

To connect a rescue to your harness we recommend using a GIN Rescue Carabiner. If you choose to use different type of connector, it should be rated at least 9 times the maximum weight. For example, our recommended 8mm Stainless Steel screwgate maillon (square) connector has a minimum breaking load of 28kN (2855 Kgf). It is the pilot's responsibility to check the compatibility of the rescue system and ensure that it is installed properly.

Be sure to inspect your connector during normal maintenance and safety checks. Replace it whenever there are any signs of wear and check your rescue system with a professional after any deployment. We recommend that you cover the connection using the Maillon rapid cover to prevent excess friction. Rubberbands should also be used to secure the attachment and prevent excess friction.

Recommended by GIN: 8mm stainless steel screwgate maillon

8mm square maillon

Breaking load: 28kN

Maillon connection (Recommended by Gin Gliders)

WARNING: When connecting the rescue bridle be sure to secure the connection using tape, rubber bands or heat shrink wrap. If the lines are not secure they may burn or cut from excess friction.

IMPORTANT: Be sure to connect both rescue bridles to the rescue.

Rescue installation guide

It is very important to properly install the rescue parachute. If the parachute is not folded correctly or the lines are not placed properly then a serious if not fatal accident could result. If you have any doubts speak with your instructor or GIN dealer.

Main rescue installation guide

Begin by first connecting the Y bridle and the rescue handle to the rescue parachute . Install the rescue into the harness with the handle connection FACING UP and the extra para line neatly folded on the bottom of the container (1). Be sure that the inner bag is installed so the rescue handle loop is facing the opening of the rescue container (2)

Using the paracord included with your harness pull the built in loops through the metal rings in the order shown below. First pull the LYME loop through the eyelet on the rescue container cover "A" (4). Next close the zipper on the bottom of the container and the zipper for the rescue bridle tunnel (5). Secure the LYME loop by inserting the ORANGE plastic wire from the rescue handle (make sure to place the ORANGE plastic wire into the wire cover shown in photo 6). Next pass the RED loop through the second eyelet "B" and through the eyelet leading into the harness "C"(7). Pass the CLEAR wire through the large eyelet "D" and from inside the harness, secure the RED loop using the CLEAR wire (make sure to place the CLEAR wire into the wire cover shown in photo 8)

*Follow the instructions on the next page.

WARNING: When installing the reserve make sure the reserve handle is up and the reserve lines are facing down.

*view inside the harness

Storage

Back pocket

The back pocket is designed to store the pilots rucksack and other light accessories during flight.

Hydration pocket / personal belongings

Located inside the back pocket is a smaller pocket that can hold a camelback or other small belongings. Above the hydration pocket is a RED loop that can be used to suspend a camelback.

Radio Pocket

Located inside of the back pocket is a radio pocket with a Velcro cover. At the top of the back pocket there are 2 holes that can be used for a radio wire and/or hydration hose.

Side pocket

Located on both sides of the harness, just under the carabiners, are two zippered pockets that can be used to store small items such as a snack or small digital camera during your flight.

Adjustments

After choosing a harness that is close to your body size, adjust your harness to suit your physique and flying style. It is important to adjust it correctly to ensure you can easily slide into the sitting position after take off. A poorly adjusted harness can adversely affect the flying characteristics of your paraglider.

Perform adjustments before your first flight by hanging in a simulator and fine-tune the settings if necessary during your first few flights.

Shoulder straps (1)

The optimum setting for the shoulder straps depends on the height of the pilot. Step into the harness and stand upright with the breast strap closed, symmetrically adjust the shoulder straps until they are a snug fit, but not tight.

To tighten: pull down on the black and green loop

To loosen: pull up on the BLACK loop on the top of the shoulder strap.

Breast strap (2)

After adjusting the shoulder straps, place the breast strap in a comfortable position and tighten so there is slight pressure on the shoulder straps.

Leg straps

The correct adjustment of the leg straps allows the pilot to easily reach the sitting position after take-off without using his hands. Use the buckles under the seat plate to adjust the leg straps so that they fit comfortably without being tight; make sure you do it symmetrically. If you need to lengthen the leg straps, first check that the shoulder straps are not too tight. It is not normally necessary to make large adjustments from the default leg strap setting.

NOTE: Make sure that the rescue system has been installed before making adjustments.

Underseat leg strap adjustment

Lateral Straps (1)

The lateral straps adjust the angle between the thighs and the back. Lengthening the straps increases the angle and vice-versa. The easiest way to adjust them correctly is during a flight in calm air. Remember that flying in the supine position (i.e. leaning back), reduces the stability of the harness and increases the risk of riser twists after a deflation.

To tighten, pull forward on BLACK and GREEN loop. To loosen, pull back on the BLACK loop.

Seat Straps (2)

The seat straps change the depth of the seat. Adjust to find a comfortable position. In the sitting position, lengthen the straps to their maximum at first and then use the plastic buckles to shorten the straps to find a comfortable position with good back support. Lengthening the straps also helps you to slide easily into the harness at take off, while shortening the straps helps you to be in the standing position for landing.

To tighten, pull up on the BLACK webbing loop. To loosen, pull up on the buckle.

Side strap (3)

The side adjustment straps allow you to adjust the angle of the front of the seat. To get the optimum setting you can loosen these straps to the maximum in the sitting position and start pulling the straps until you get the comfort from the leg support depending on the flying style of the pilot.

To tighten, pull up on the RED loop. To loosen, pull up on the buckle.

Speed Bar

Hanging in the simulator, adjust the length of the speed bar cord so that the bar hangs at least 15cm below the front of the harness. Making the cord too short could result in the speed system being constantly or unintentionally engaged during flight. It is safer to start with the speed bar a little long and shorten it following your first flights. Test the speed bar in flight only after you are comfortable with your new harness, and always do so in calm conditions with enough clearance above the ground.

- ① Lateral strap
- ② Seat strap
- ③ Side strap

Cocoon Adjustment

The cocoon should be tight and the harness fabric should be smooth and wrinkle free to create the best aerodynamic shape. The nose of the cocoon should form a straight line and point slightly down. Tighten the orange line to raise the nose of the cocoon, loosen to allow the nose to drop and extend the length of the cocoon. Tighten the blue line to pull the nose down, loosen to allow the nose to pull up and lengthen the cocoon. Adjust the cocoon first and then make the shoulder straps snug.

There are 3 markers on each adjustment line to indicate the minimum (-5), middle (0) and maximum (+5) adjustment settings for the cocoon.

Flying with the Genie Lite 2

General warnings and advice

Before every flight, check the following:

- Are you in good physical and mental condition?
- Are you familiar and compliant with all applicable laws and regulations in your area?
- Are you within the certified weight range of your paraglider?
- Do you have the necessary valid insurance cover (e.g. liability, medical, life)?
- Are you briefed thoroughly about the site, airspace and expected weather conditions of the day?
- Is your equipment and choice of site suitable for your level of experience?
- Do you have a suitable helmet, gloves, boots, eye-wear and adequate clothing?
- Are you carrying some form of identification, so that people know who you are in case of an accident? Take along a radio and mobile phone if possible.
- Do you fully understand how to safely use your new equipment? If not, have your instructor or dealer explain anything you are not sure about.

When you go for your first flight on your new harness, be sure to pick a day and site that does not present you with any unfamiliar challenges. During your first flight, familiarize yourself with the in-flight characteristics of your new harness.

Pre-flight checks

As part of your normal pre-flight check routine, check:

- Is there any damage to the harness or carabiners that could affect its airworthiness?
- Is the rescue parachute container closed correctly with the pins in the right position?
- Is the deployment handle correctly inserted or attached?
- Are all buckles, belts, zips securely fastened? Buckles should click into place as you close them, and a gentle pull on the fastened buckle verifies this. Secure any zips after fastening the buckles. Take extra care in snowy or sandy environments.
- Is the paraglider connected correctly to the harness with both carabiners secured by their locking mechanisms?
- Is the speed bar attached correctly to the glider?

IMPORTANT: Use a complete and consistent system of pre-flight checks and repeat the same sequence every flight.

- ☑ Are all pockets closed properly and any loose items tied down safely?
- ☑ Is the air chamber intake open and clear?
- ☑ Have you closed your leg and chest straps? Double check before you take off!

Rescue Deployment

In the event of an emergency, you must quickly evaluate your height and the seriousness of the incident. A seconds hesitation in deploying the reserve could prove fatal if there is insufficient height. On the other hand, deploying the rescue when the glider is recoverable may result in needless injury.

If you decide to deploy the rescue:

- 1) Look for the rescue handle and grasp it firmly with one hand
- 2) Pull forwards and upwards on the handle to release the deployment bag from the rescue container.
- 3) Look for a clear area, and in a continuous motion, throw (and RELEASE!) the rescue away from yourself and the glider, preferably into the air stream or against the direction of spin. After deployment, avoid entanglement and pendulum motions by promptly pulling in the glider as symmetrically as possible with the B, C, D or brake lines.
- 4) On landing take an upright body position and be prepared to do a PLF (Parachute Landing Fall) to minimize the risk of injury.

IMPORTANT: In normal flight, periodically feel the position of the rescue handle so that the action of reaching for the rescue handle is instinctive in an emergency.

WARNING: During any incident in flight, always monitor your altitude. If you have any doubt that you have sufficient height for recovery, deploy your reserve without hesitation. “If low, then throw”.

NOTE: After any rescue deployment, it is essential to have your harness thoroughly inspected by a qualified professional to be sure there is no damage to the rescue connection points, rescue bridle or any other parts.

Landing with the Genie Lite

Before landing, slide your legs forward in the harness so that you adopt the standing position. NEVER land in the seated position—it is very dangerous even if you have back protection. Standing up before landing is an active safety precaution.

Miscellaneous

Towing

The Genie Lite 2 can be used for towed launches. The Gin Towing Bridle can be hooked directly to the main carabiners. For further details, refer to the documentation provided with your tow release, or ask a qualified towing instructor at your flying site.

Tandem Flying

The Genie Lite 2 is not designed for tandem flying. See www.gingliders.com for details of our harnesses specifically designed for tandem flying.

Flying over water

Water landings should be avoided at all costs, as the back protection increases the risk of the pilot floating in a head-down position. For safety training over water, we recommend wearing a proper flotation vest with a head support holding the wearer's head above the surface even when unconscious.

Maintenance and repairs

The materials used in this harness have been carefully selected for maximum durability. Nevertheless, keep your harness clean and airworthy to ensure the longest possible period of safe operation.

Care and maintenance

Don't drag your harness over rough or rocky ground. Avoid unnecessary exposure to UV rays, heat and humidity. Keep the folded harness in your rucksack when not in use.

Store all your equipment in a cool, dry place, and never put it away while damp or wet. Regularly clean off dirt with a plastic bristled brush and/or a damp cloth. If the harness gets exceptionally dirty, wash it with water and a mild soap. Make sure you first remove the entire sub-components for example, rescue parachute etc. Allow the harness to dry naturally in a well ventilated area away from direct sunlight. If your rescue parachute ever gets wet (e.g. in a water landing) you must separate it from the harness, dry it and repack it before putting it back in its separate outer container. Occasionally lubricate the zips and buckles with silicone spray, no more than once a year.

After a hard landing you must check your harness for damage, pay close attention to the rescue container and verify all of the attachments are secure.

Inspection checklist

In addition to regular pre-flight checks, your harness should be inspected thoroughly on every rescue repack of 150 days. Additional inspections should be performed after any crash, bad landing or take off, or if there are any signs of damage or undue wear. Always seek professional advice whenever in doubt.

The following checks should be carried out:

- ☑ Check all webbing, straps and buckles for wear and damage, especially the areas that are not easily seen, such as the inside of the carabiner hook-in points.
- ☑ All sewing must be intact and any anomalies attended to immediately to avoid exacerbation of the problem.
- ☑ Special attention should be paid to the rescue installation, particularly the elastic and Velcro parts.
- ☑ The main carabiners must be replaced at least every 5 years or after 500 hours, whatever comes first. Impacts may create undetectable cracks that could result in structural failure under continuous load.

IMPORTANT: Any repairs should only be carried out by the manufacturer or by an approved agent. This will ensure that the correct materials and repair techniques are used.

Repairs

The manufacturer or an approved specialist should carry out any repair that involves critical parts of the harness. This will ensure that the correct materials and repair techniques are used.

Storage

Stored at a temperature between 10° and 25° C and in relative humidity between 50 and 75%. Make sure too that the harness is not stored in a place where animals such as mice or cats could use it as a place to sleep.

Do not store the harness near any chemicals. Petrol, for example, causes the material to disintegrate and can cause considerable damage to your harness. When your equipment is in the car boot, keep it as far away as possible from any spare petrol cans or oil containers.

The harness should not be exposed to extreme heat (e.g. in the boot of the car during summer). High temperatures accelerate the process of hydrolysis, particularly when combined with moisture, which damages fibers and coating. Do not store your harness near radiators or other heat sources. Always transport your glider in the special concertina bag and use the backpack provided for the rest of the equipment.

GIN quality and service

We take pride in the quality of our products and are committed to putting right any problems affecting the safety or function of your equipment and which are attributable to manufacturing faults. Your GIN dealer is your first point of contact if you have any problems with your equipment.

If you are unable to contact your dealer or GIN importer, contact Gin Gliders directly via our website.

GIN lifetime guarantee

Gin Gliders are proud to guarantee the quality, craftsmanship and performance of all our products. Equipment with defects in materials or manufacturing will be repaired or replaced at the discretion of Gin Gliders for the practical lifetime of the product. Equipment damaged through wear and tear, misuse or neglect may be repaired at a nominal charge.

If you have any problems with your equipment, please contact your GIN dealer in the first instance, or Gin Gliders directly via our website.

Care of the environment

We are privileged to fly in areas of outstanding natural beauty. Respect and preserve nature by minimizing your impact on the environment. When visiting an area, contact the local club for details of environmentally sensitive areas and local restrictions.

Gin Gliders gives consideration to the entire life cycle of its harnesses, the last stage of which is recycling in an environmentally-friendly manner. The synthetic materials used in a harness must be disposed of properly. If you are not able to arrange appropriate disposal, Gin Gliders will be happy to recycle the harness for you. Send the harness with a short note to this effect to Gin Gliders Inc.

Final words...

Most of us today live in a dependent society where we are regulated and protected. There are few opportunities for individuals to develop the self-responsibility that is the foundation of safety in extreme sports such as paragliding.

Most accidents are caused by getting into situations that are too demanding for your level of experience. This happens if you lack fundamental understanding, are incapable of assessing the risk or simply do not pay sufficient attention to your surroundings or your own state of mind.

To stay safe, the best you can do is to increase your understanding, skill and experience at a rate you can manage safely. There is no substitute for self-responsibility and good judgment.

In the end, paragliding offers a unique opportunity to learn to take control of your own destiny.
Memento mori, carpe diem!

Fly safely, and...E N J O Y!
